MariTime HDMI ver 219 release notes (2016-07-11)

A number of bugs have been corrected:

1. Sometimes, when using the (new) "**Resume Capture**" button on the video replay form, the registred heat times on a file open at this moment would be erroneously cleared.

2. When MariTime can't find the relevant video souce/property it will tell you to Re-select this source and also open the Video select form. If you select "Cancel", the same procedure will be done again, in effect putting you in an endless loop (forcing a shurt down using Task manager)

3. Windows 10 and the mouse wheel
   This a "tricky one"…
   On the Video replay form, the *slider control* is central, since it will control movement in the recorded video file. To this end, mariTime allways tries to keep this control "in focus", meaning that it will react to events from the arrow keys, and also the mouse wheel.

   However, with Windows 10 something has changed that is really outside of my control. It seems that events from the mouse wheel is no longer automatically reaching the slider control. (Arrow keys still function). If the mouse cursor is positioned inside the "activa area" of the slider control there seems to be some (sluggish) reaction to the mouse wheel. Solution: (almost…) : On the Settings meny on the replay form, you can select the "Handle mouse wheel events". This means that MariTime will "hook"inte the Windows message stream and intercept all the mouse wqheel events that "it sees" and act upon them. If you sekect this oiption, you should get a mouse wheel functio that is almost as good as before. However I am expecting Microsoft to issue some kind of fix to something that must be their fault…

A number of smaller changes of a "cosmetic" nature have been made as well...
